GIT-APE EXECUTIVE BRIEFING

Deploy Azure Infrastructure

With a Single Sentence

Git-Ape for Engineering Leaders

Security gate | Cost visibility | Governance built in

AI-powered cloud deployment

Executive briefing | 10 slides

Live demo ready

The Challenge

Cloud Deployment Is Your Biggest Bottleneck

73%

teams wait days for infrastructure changes

$4.35M

average cost of a cloud breach incident

The executive problem

- **Shadow IT** grows when the approved path is too slow.
- **Security exposure** rises when changes skip guardrails.
- **Cost surprises** arrive after deployment, not before it.

Delay | Risk | Unplanned spend

What If Deployment Was This Easy?

One Sentence. Production-Ready Infrastructure.

Input

> "Deploy a web app with SQL database for the inventory app in production"

Output in 2 minutes

- **7 resources** scaffolded
- **12 security checks** passed
- **$92/month** estimated cost
- **Architecture diagram** generated
- **Deployment** validated and tested

7 resources **12 checks passed** **$92/month estimate**

Built-In Security Guardrails

Security Is Not Optional — It's Enforced

Deployment stops when

- Critical findings exist
- High-risk settings are misconfigured
- Required controls are missing

Default controls

- Managed identities — no passwords
- HTTPS and TLS 1.2+ enforced
- Azure AD auth for databases
- Key Vault for all secrets

The key point for leadership: insecure defaults are removed from the deployment path, not left to individual engineers.

Cost Transparency

Know What You Pay Before You Deploy

- **Live estimates** from the Azure Retail Prices API
- **Per-resource monthly breakdown** for clear review
- **SKU comparisons** for dev and production sizing
- **PR visibility** so reviewers see price before approval

$45 - $120

typical monthly range for Function App + Storage + Monitoring

The point is not perfect prediction. It is cost visibility early enough to change the plan.

Compliance and Governance

CIS, NIST, and Custom Policy — Automated

Coverage

- **CIS Azure Foundations v3.0**
- **NIST SP 800-53**
- **Custom enterprise policy** sets

Outcomes

- Per-resource compliance scoring
- Audit trail for every deployment
- Drift detection for manual changes
- Audit or deny enforcement modes

🛡️ Policy checks before approval

📋 Evidence trail for audits

Architecture Quality

AI-Powered Well-Architected Framework Review

1. **Security** — identity, encryption, access control
2. **Reliability** — monitoring, backup, resiliency
3. **Performance** — right-sizing and scaling
4. **Cost** — waste reduction and tier fit
5. **Operational excellence** — IaC, observability, runbooks

The AI evaluates each deployment like an experienced cloud architect before it reaches production.

How It Works

A Conversation, Not a Configuration File

Ask
Describe the workload in plain English

→

Clarify
Answer a few questions on env, region, scale

→

Review
Security, cost, and architecture outputs

→

Deploy
Approve and deploy, or stop at review

No ARM templates to write. No CLI sequence to memorize.

Demo Time

Watch It Deploy Live

We will show

1. One-sentence request
2. Clarifying answers
3. Security, cost, architecture outputs
4. Deployment confirmation

Demo target

Python Function App with storage and monitoring in **about 2 minutes**

Pre-recorded backup available if network latency gets theatrical.

Results and ROI

What Engineering Leaders Get

Benefit	Impact
Faster deployment	Days to hours, or minutes for simple workloads
Fewer incidents	Guardrails and blocking security gates
Cost predictability	Estimates before approval
Governance at scale	Audit trail, drift detection, policy enforcement
Team autonomy	Less waiting on a central platform queue

Bottom line

More deployments. Fewer emergencies. Better control.
